

## HARDIDECK PLATFORM

The HARDIDECK Platform is a revolutionary new product from Samson Equipment which has been designed as a cross-over between a fixed and a retractable crane loading platform. It has taken the advantages of both types of system and combined them to produce a product that is truly unique.

As with a retractable platform, Hardideck's can be installed in a vertical 'stack' directly above one another allowing the remainder of the building to be closed up, but unlike the retractable platform, the deck finishes flush with the floor slab so no ramp or loss of headroom when installing tall objects such as bathroom pods into the structure.

It achieves this by the clever use of a detachable 'Outboard' section which can be lifted up or down to the required floor level and then connected to a pre-installed 'Inboard' section.

This has the advantage of never having to relocate the whole platform to another level as the 'Inboard' sections remain in place at all times.

Relocation of the 'Outboard' section to another level takes less than 2 minutes and as all actions are carried out from within the safety of the 'Inboard' section, there is no need for safety harnesses as operatives are never exposed to an open edge.

Crane utilization is vastly increased as the operator is always picking from the same position so loads can be landed that much quicker increasing productivity on site.
