The Samson CraneDeck™ is a simple and easy to use cantilever crane loading platform designed for the loading of general construction materials, quickly and safely into or out of high-rise construction projects.

Quickly and easily installed into either steel or concrete framed structures, the Samson CraneDeck can dramatically reduce the time it takes to load out floors by lifting materials directly from transport to the required floor whilst vastly increasing crane productivity on site.

A ‘flush to floor’ landing deck allows tall objects such as pre-fabricated bathroom pods to be easily installed between floor plates with no loss of headroom.

Folding rear props allow for easy installation with a luffing jib crane and the ability to adjust the props at head height without using a ladder means there is no working at height when tightening the props to the soffit.

Other safety features unique to the Samson CraneDeck are side panels that extend fully into the building so no gaps at the slab edge plus a load bearing outer rail in place of the hazardous gates often found on other cantilever platforms.

Available in various sizes and capacities to suit any application, the Samson CraneDeck is a simple, robust and value for money option for contractors needing to lift and load out materials quickly and safely on high-rise construction sites.

The CraneDeck is designed and manufactured in Great Britain by Samson Equipment Ltd, the industry experts in innovative lifting and handling equipment to the high-rise construction industry.
Super lightweight design reduces the loadings on the supporting structure.

**Unique to Samson CraneDeck

Compared to other manufacturers

Fold down props for easy installation with luffing jib cranes.

Prop can be tightened at head height without the need for ladders or steps.

A shorter inboard means less obstruction within the building.

Side panels extend past the slab edge into the building so no gaps in edge protection.

Super lightweight design reduces the loadings on the supporting structure.

Perfectly positioned lifting eyes ensure a level lift with no adjustment of crane chains needed.

Load bearing top rail can support long loads such as scaffold tubes and formwork beams.

Solid end panels instead of gates keep operatives extra safe.
